

**A female buffalo has given birth to three calves (2 female 1 male). Become centre of attraction village Gulan Khan Bhambhro in District Sanghar province Sindh Pakistan.**

The buffalo has delivered the three calves at delivering time with two females and one male calf with normal delivery. All the calves are said to be in good health and physical conditions. Ghulam Hussain Shar from Village Gulan Khan Bhambhro is the owner of the buffalo. There was a surprise when his buffalo delivered three calves. The buffalo, which gave birth to triplets, belongs to Kundi breed Buffalo of Pakistan. Kundhi buffalo horns are broad at the base and taper upward and inward, giving them a fishhook shape, hence the name in local Sindhi language is called “Kundhi”.

Kundhi is the local buffalo breed of Pakistan. The Kundhi breed is milk type breed. It is found in Dadu, Hyderabad, Karachi, Larkana, Nawabshah, Sanghar and Thatta districts in Sindh Province. The color is solid black. The average weight at maturity for the male is 600 kg and 375 kg for the female. Kundhi buffaloes are originated throughout Sindh, mainly on both sides of the Indus River from Kashmore district in the north to Shah Bandar city in the south on the coast of the Arabian Sea.

As for buffalo concern, it is believed that a female buffalo delivering only one calf, however twins are rear, while incidents of cows delivering twins have been reported. Ghulam Hussain Shar is a former by profession, he is happy about the triplets calf arrivals at his home.

The water buffalo or domestic Asian water buffalo (*Bubalus bubalis*) is a large bovine originating in South Asia and China. Today, it is also found in Europe, Australia, and some American countries. Two extant types of water buffalo are recognized based on morphological and behavioral condition (1) the river buffalo of South Asia and further west to the Balkans, Egypt, and Italy, and the (2) swamp buffalo, found from Assam in the west through Southeast Asia to the Yangtze valley of China in the east . There are at least 130 million domestic water buffalo, and more human beings depend on them than on any other animal. They are especially suitable for tilling rice fields, and their milk is richer in fat and protein than that of dairy cattle.

Although buffalo are polyestrous, their reproductive effectiveness shows extensive variation throughout the year. Buffalo and cows show a different seasonal change in displaying estrus, conception rate, and calving rate. The age at first estrus of heifers vary between breeds from 13–33 months, but mating at the first estrus is often infertile and usually deferred until they are 3 years old. Gestation lasts from 281–334 days, but the majority information gives a range between 300 and 320 days. Swamp buffalo carry their calves for one or two weeks longer than river buffalo.
